SCOPE OF WORK

All-in-One Super App

Utility payments, marketplace, home services, property, vehicles, and authority directory

Project type: Multi-service consumer application with shared account and admin layer.

Modules: Recharge and bills; buy/sell marketplace; home services; property listings; vehicle services; public/private authority directory.

1. Project Overview

The project covers planning, design, development, testing, and deployment of an application that brings multiple everyday services into one platform. Users can access recharge and bill-payment services, buy and sell products, find home-service providers, browse property and vehicle listings, and discover public or paid private authorities.

The final implementation depends on the target market, client operating model, provider arrangements, third-party API availability, and detailed rules for each module. The supplied feature list is the baseline; unresolved details must be confirmed before final estimates.

2. Project Objectives

- Provide one unified app with clearly separated service modules.
- Let users browse, search, submit requests, and manage relevant activity.
- Provide listing and management workflows for sellers, service providers, and administrators.
- Integrate recharge, utility-payment, and e-challan services only where authorized providers/APIs are available.
- Provide admin tools for users, listings, categories, transactions, and operational records.
- Build a maintainable foundation for phased expansion.

Scope note: not every external payment or government service provides a public integration API. Integration availability must be validated before commitment.

3. Recharge & Utility Bill Payments

This module provides a common entry point for supported recharge and bill-payment services. Transaction processing depends on the selected aggregator/provider and API access.

3.1 Mobile and TV/DTH recharge

- Support prepaid/postpaid mobile recharge and DTH/dish recharge for supported operators.
- Collect required mobile/account details, operator, and amount; show confirmation before submission.
- Display provider-backed transaction status and reference for successful, pending, or failed requests.

3.2 FASTag recharge

- Provide FASTag recharge for supported issuers/providers.
- Collect the required tag, vehicle, wallet, or customer identifier.
- Show amount and provider before confirmation and display the resulting transaction status.

3.3 Electricity bill payment

- Allow selection of supported electricity provider and entry of consumer/reference number.
- Fetch bill amount/due details only if supported by the approved API.
- Submit payment and show provider confirmation or pending/failed status.

3.4 Loan EMI and credit card bills

- Provide payment flows for supported lenders/card issuers where an approved integration exists.
- Collect required account/reference details and payment amount.
- Use provider-approved secure payment handling; do not store raw card credentials.

3.5 Transaction history and reconciliation

- Store service type, amount, date, reference, and status for each initiated transaction.
- Provide user history and admin transaction lookup.
- Define reversals, refunds, disputes, settlement, and failed-transaction handling based on provider capabilities.

3.6 Dependencies

- Client confirms target country, currency, operators, billers, payment aggregator, and commercial terms.
- API access, merchant onboarding, transaction limits, settlement, and fees depend on third-party approval.
- Government, utility, loan, and credit-card coverage is not guaranteed until providers are confirmed.

Acceptance: a user can complete a supported transaction flow and view a traceable provider-backed status.

4. General Product Buy/Sell Marketplace

The marketplace lets users list and discover new and used products. Payment, shipping, escrow, and dispute processes need separate approval.

4.1 Product listings

- Create listings for new or used products with title, description, category, condition, price, images, and seller area/contact fields as agreed.
- Allow sellers to edit, deactivate, or remove listings subject to platform policy.
- Support statuses such as draft, active, inactive, or under review.

4.2 Browse and search

- Display product categories and listing details.
- Provide keyword search and basic filters such as category, condition, price range, or location where approved.
- Show images, price, condition, and relevant seller details.

4.3 Buyer/seller workflow

- Allow buyer inquiries/contact using the agreed communication method.
- Provide users with their own listings and inquiry history where included.
- Allow reporting of suspicious listings and admin review/removal.

4.4 Marketplace transaction assumptions

- Baseline assumes listing and buyer-seller discovery; in-app checkout is excluded unless approved.
- Online payment, shipping, delivery, escrow, commission, returns, warranty, and dispute workflows require separate definition.

5. Home Services

Help users discover electricians, plumbers, masons (Raj Mistri), labourers, and other agreed local service providers.

5.1 Provider directory and requests

- Show service categories and provider profiles, service area, and contact options.
- Support search/filter by service category and location where feasible.
- Allow a user to submit an inquiry/request with description, location, and preferred time if approved.
- Allow providers/admins to update relevant profile and availability details.

5.2 Reviews and administration

- Ratings/reviews are included only if approved; define who may submit them.
- Provide reporting for inaccurate listings and admin tools for categories/providers/requests.
- Background checks, certification, appointment scheduling, and in-app service payments are excluded unless added.

Deliverable: product listing and home-service discovery/request flows based on the approved operating model.

6. Property, Vehicle Services & Find Here Directory

These modules provide searchable listings and service information. Official payments and other transactions require a supported and authorized integration.

6.1 Property buy/sell listings

- List plots for resale and houses for sale with title, type, price, description, location, images, and seller/agent contact details.
- Provide browsing, detail pages, basic search, and filters by property type, price, and location.
- Allow owners/agents to manage listings and admins to review/remove listings.
- Ownership verification, legal checks, brokerage, and rental management are excluded unless approved.

6.2 Vehicle marketplace and rental

- Support vehicle sale listings with make, model, year, price, condition, images, and location.
- Provide vehicle rental listing/request flow if confirmed by client.
- Rental booking calendars, deposits, cancellations, insurance, and payments require separate definition.
- Allow sellers/rental providers to manage listings and respond to inquiries.

6.3 E-challan payment

- Provide an e-challan lookup/payment entry point only for supported authorities or approved providers.
- Collect required reference/vehicle details and show challan details only when returned by the authorized service.
- Display payment status/reference if the provider supports confirmation.
- If no approved API exists, a link to the official portal may be used; automated payment is not assumed.

6.4 Find Here: public and paid private authorities

- Provide a directory of government bodies/public authorities and paid private organizations.
- Organize entries by category, area, or service type.
- Show approved details such as name, description, area/address, phone, website, hours, and service information.
- Provide keyword search and category/location filters where supported.
- Paid listings, featured placement, subscriptions, or listing fees need an approved billing workflow.

6.5 Shared listing controls

- Use consistent categories, images, statuses, and contact fields where applicable.
- Allow reporting and admin review of inaccurate or prohibited content.
- Define listing ownership, expiry, duration, and renewal rules with the client.

Deliverable: searchable property, vehicle, and authority listings, plus only the booking/payment integrations explicitly approved.

7. Shared Platform, Admin, Security & Delivery

Because the app spans several service domains, module priorities should be agreed with the client and delivered in phases.

7.1 Shared user experience

- Provide a home dashboard linking to recharge/bills, marketplace, home services, property, vehicles, and Find Here.
- Support registration/login when user-specific transactions, listings, or requests require accounts.
- Provide profile and activity views for enabled modules, with consistent navigation and error states.

7.2 Admin dashboard

- Secure admin login and agreed role-based access.
- Manage users, categories, product/property/vehicle listings, service providers, and directory entries.
- View transaction records/statuses for enabled recharge and bill-payment integrations.
- Review reported listings and update/remove content according to platform policy.
- Provide basic search, filters, sorting, and pagination.

7.3 Backend, security, and backups

- Build APIs and data structures for accounts, listings, service requests, transactions, and admin functions.
- Validate inputs and enforce permissions for protected operations.
- Keep API secrets in protected server-side configuration, not public mobile code.
- Protect contact details and transaction records; avoid storing sensitive payment credentials.
- Configure or document database backup/recovery for the chosen hosting environment.
- Document key APIs, data entities, and third-party dependencies.

7.4 Testing, deployment, and handover

- Test enabled module flows, transaction states, listing permissions, and common failure cases.
- Run regression tests for accounts, listings, requests, and admin access.
- Provide agreed source code/repository access, setup/deployment instructions, and technical documentation.
- Define post-launch support and maintenance terms in the project agreement.

7.5 Proposed delivery phases

Phase 1 — Discovery: confirm market, platforms, integrations, module priorities, and business rules.

Phase 2 — Foundation: build account system, app structure, backend, database, and admin base.

Phase 3 — Core modules: implement prioritized marketplace, services, property, vehicle, and directory workflows.

Phase 4 — Payments: integrate approved recharge and bill-payment providers.

Phase 5 — QA and handover: test, deploy, document, and transfer the agreed deliverables.

7.6 Assumptions, exclusions, and acceptance

- Client confirms country, currency, platform(s), user roles, service areas, commercial model, and launch priorities.
- Third-party APIs/approvals, hosting, SMS, domain, payment, and provider fees are excluded unless agreed.
- Marketplace checkout/escrow, delivery logistics, property verification, vehicle rental management, paid directory subscriptions, and advanced analytics are excluded unless approved.
- Government/e-challan integration depends on authorized provider access; no integration is guaranteed before validation.
- Any feature not expressly included requires written change approval and may affect cost/timeline.
- Acceptance: agreed priority modules work end-to-end, admins can manage relevant records, supported transactions have traceable statuses, and code/documentation are handed over.

End of Scope of Work — final requirements, schedule, acceptance tests, and support terms should be confirmed in the project agreement.
